Vol. 11, No. 26

PROVISIONAL INFORMATION ON SELECTED NOTIFIABLE DISEASES IN THE UNITED STATES AND ON DEATHS IN SELECTED CITIES FOR WEEK ENDED JUNE 30, 1962

POLIOMYELITIS - During the week ending June 30, 1962, 19 cases of poliomyelitis, 16 paralytic, were reported for the United States. Texas reported the largest proportion of these with 10 cases, 7 paralytic. California reported four cases (one with 1961 onset) and the States of New York, Ohio, West Virginia, Tennessee and Oregon accounted for one each.

The cumulative totals through the 26th week for the past 5 years are shown below. The totals in 1962 are comparable to those of the record low year, 1961.

	1962	1961	1960	1959	1958
Paralytic	158	155	346	694	333
Total	202	239	469	1,026	644

The six-week cumulative totals (21st thru 26th week) for the past 5 years are shown below:

	1962	1961	1960	1959	1958
Paralytic	66	48	131	357	149
Total	78	79	170	543	299

In Texas, the scene of poliomyelitis activity has shifted from the Southern counties of Bexar (San Antonio) and Webb (Laredo) where oral vaccine was administered in late May and early June, to counties in the North and East. Only one case, paralytic, was reported from Bexar County. This child had not received the oral vaccine.

Harris County (Houston) reported two paralytic and two non-paralytic cases this week. This brings the 1962

Table 1. CASES OF SPECIFIED NOTIFIABLE DISEASES: UNITED STATES
(Cumulative totals include revised and delayed reports through previous week)

Disease	26th Week			Cumulative

Table 2. NOTIFIABLE DISEASES OF LOW FREQUENCY

Anthrax:
Botulism:
Malaria: Ill. - 1, Mo. - 1
Plague:

Psittacosis:
Rabies in Man:
Smallpox:
Typhus, murine:

total of paralytic cases for this county up to 6. Viral specimens from two early cases have yielded type I poliomyelitis virus.

Dallas County (Dallas) reported three paralytic cases, lifting their 1962 total to four. Virus isolations have not been reported.

HEPATITIS – The number of hepatitis cases reported for the week ending June 30 fell to 712. It is notable that, for the first time since the initiation of reporting of hepatitis cases over and under 20 years, the percentage of adult cases (over 20 years) exceeded the percentage of childhood (under 20 years) cases.

EPIDEMIOLOGICAL REPORTS

Vending Machine Salmonellosis – Colorado

Between April 20 and 27, six adults in Denver, Colorado, experienced a gastrointestinal illness severe enough in four cases to warrant hospitalization. The illness was characterized by fever, nausea, vomiting, abdominal cramps, and diarrhea. All six cases were found to have consumed chocolate eclairs obtained from refrigerated, automatic vending machines. *Salmonella typhimurium* was cultured from stool samples of all the cases. Characteristics of the cases are shown below. The 2 cases (Nos. 4 and 5) with short incubation periods had both undergone partial gastrectomies in the past.

Case	Age	Sex	Onset of Symptoms	Incubation Period
1	43	F	4/21	16 hours
2	33	M	4/25	12 hours
3	42	M	4/25	15 hours
4	45	M	4/27	7 3/4 hours
5	53	M	4/27	4 1/2 hours
6	40	M	4/27	9 hours

The food histories of all cases were identical with regard to consumption of eclairs but varied widely in all other respects. The eclairs consumed were obtained from three different vending machines supplied by a single bakery. Under questionable conditions of sanitation and in quarters with evidence of rodents and cockroaches, the bakery produced an average of 80 dozen eclairs each day. Each of the bakeries' employees who handled food in any of its stages of preparation was found to be free from salmonella by stool culture.

Eclairs were prepared by using a commercial cream filler and commercial icing. The pastry shell included frozen eggs in its ingredients. These eclairs were prepared, and individually wrapped, by 9:00 A.M. each morning and then were left at room temperature on trays until collected by representatives of the companies purchasing them. In no instance were the eclairs at the incriminated

vending machines delivered to machines until the following morning, approximately 24 hours after the baking.

The *S. typhimurium* phage type from 2 of the patients and from environmental samples of the bakery were the same, Type C.

(Reported by Dr. J. D. McCluskie, Director, Environmental Health Services, Dept. of Health & Hospitals, Denver, Colorado.)

Influenza A₂ – Minnesota

Approximately 100 cases of Influenza A₂ (Asian) occurred in a Veterans Administration Hospital in Minnesota during the month of May. Cases were first noted in the first week of May. The epidemic reached its peak in the middle of the month and then gradually subsided. Symptoms consisted of chills, fever, malaise, scratchy sore throats, myalgia, cough, and occasional conjunctivitis. The symptoms lasted several days; there were a few cases of pneumonia but no deaths. Cases were most common among hospital patients with an occasional case among the staff and personnel. The staff and personnel had been given polyvalent vaccine on a voluntary basis last fall; no vaccine had been given to the patients on an organized basis. Serologic evidence of Influenza A₂ was demonstrated in paired blood specimens from four patients and Influenza A₂ (Asian) virus was isolated from a throat washing of one patient.

This outbreak represents the second reported Influenza A₂ (Asian) outbreak reported this year. The other outbreak occurred in Bellingham, Washington, in March 1962 (See MMWR, Vol. 11, No. 12).

(Reported by D. S. Fleming, M.D., Director, Division of Disease Prevention and Control, State of Minnesota Department of Health, Minneapolis 14, Minnesota.)

Acute Gastroenteritis Aboard a Naval Vessel

An outbreak of 26 cases of acute gastroenteritis occurred among the 247 officers and men aboard a U. S. Navy destroyer during the 4 day period, March 18th through 21st, while the ship was berthed at Naples, Italy. The illnesses were of one or two days duration and consisted of one or more of the symptoms of nausea, vomiting, diarrhea, and abdominal cramps. Many patients also experienced headache and malaise, and one had a slightly elevated temperature.

No consistent associations were found between onsets of illness and meals or other activities afloat or ashore, and no sanitary discrepancies were found aboard ship. Rectal swab cultures from 21 ill persons and 14 food service personnel were negative for pathogenic bacteria.

Half of the cases (13) occurred among the 49 junior enlisted men of one department, all of whom were berthed together apart from the rest of the crew (attack rate of 26.5%). Of the remaining 13 cases, one was in an officer,

and 12 were randomly distributed among the 158 junior men of the other departments of the ship (attack rate of 7.6%). The cases in the one department appeared approximately one day before the others.

DATES OF ONSET BY 6-HOUR PERIODS

Of particular interest is the fact that 2 of the 5 epidemic investigators subsequently developed the illness. They were the only 2 of the investigating team to enter the berthing spaces. One developed symptoms 12 hours and the other 19 hours following entry of the ship.

It was concluded that the outbreak was probably viral in etiology, with a short incubation period, and with person-to-person spread.

(Reported by LCDR Richard H. Svihus, MC, USN, Epidemiologist, and Capt. Sidney A. Britten, MC, USN, Officer in Charge, U. S. Navy Preventive Medicine Unit #7.)
